

Role of the Landscape Architect

Landscape architects plan, design, and implement green infrastructure at all scales. Landscape architects work with policymakers, planners, architects, engineers, ecologists, scientists, and horticulturalists to implement best practices for green infrastructure systems and designs, ensuring these systems deliver benefits to both natural wildlife and human communities.

Landscape architects are involved in regional master planning, conservation and restoration efforts, urban design, and park and green roof design and construction. At all scales, they bring a critical eye for pedestrian and artistic value to the design process.
